The Argument Builder Shelly Johnson 2008-05-01 Have you ever wanted to prove a point but you didn't know how to do it? Have you ever been stuck in an argument in which your opponent makes several strong points but you don't know what to say? If so, this is just the book for you! The Argument Builder is the ideal companion to The Art of Argument for students in eighth grade and up, as well as many curious adults! The Argument Builder trains students to build their own sound and persuasive arguments. Written in a conversational, humorous, and easy to understand style, the text is a blend of logic and rhetoric-students first study the logical structure of good arguments and then study how to use several lines of argument (a.k.a., the common topics, first invented by Aristotle) including examples, analogy, comparison, testimony, and statistics, and layer them together into a strong whole. The text comes in a workbook format with many everyday examples, funny illustrations, and plenty of exercises to ensure students learn to become skilled argument makers!

Mapping Biology Knowledge K. Fisher 2006-04-11 Mapping Biology Knowledge addresses two key topics in the context of biology, promoting meaningful learning and knowledge mapping as a strategy for achieving this goal. Meaning-making and meaning-building are examined from multiple perspectives throughout the book. In many biology courses, students become so mired in detail that they fail to grasp the big picture. Various strategies are proposed for helping instructors focus on the big picture, using the `need to know' principle to decide the level of detail students must have in a given situation. The metacognitive tools described here serve as support systems for the mind, creating an arena in which learners can operate on ideas. They include concept maps, cluster maps, webs, semantic networks, and conceptual graphs. These tools, compared and contrasted in this book, are also useful for building and assessing students' content and cognitive skills. The expanding role of computers in mapping biology knowledge is also explored.

High-School Biology Today and Tomorrow National Research Council 1989-02-01 Biology is where many of science's most exciting and relevant advances are taking place. Yet, many students leave school without having learned basic biology principles, and few are excited enough to continue in the sciences. Why is biology education failing? How can reform be accomplished? This book presents information and expert views from curriculum developers, teachers, and others, offering suggestions about major issues in biology education: what should we teach in biology and how should it be taught? How can we measure results? How should teachers be educated and certified? What obstacles are blocking reform?

Fulfilling the Promise National Research Council 1990-02-01 Why are students today not learning biology, appreciating its importance in their lives, or pursuing it as a career? Experts believe dismal learning experiences in biology classes are causing the vast majority of students to miss information that could help them lead healthier lives and make more intelligent decisions as adults. How can we improve the teaching of biology throughout the school curriculum? Fulfilling the Promise offers a vision of what biology education in our schools could beâ€"along with practical, hard-hitting recommendations on how to make that vision a reality. Noting that many of their recommended changes will be controversial, the authors explore in detail the major questions that must be answered to bring biology education to an acceptable standard: how elementary, middle, and high-school biology education arrived at its present state; what impediments stand in the way of improving biology education; how to properly prepare biology teachers and encourage their continuing good performance; and what type of leadership is needed to improve biology education.

Handbook of Research on Science Education Norman G. Lederman 2014-07-11 Building on the foundation set in Volume I—a landmark synthesis of research in the field—Volume II is a comprehensive, state-of-the-art new volume highlighting new and emerging research perspectives. The contributors, all experts in their research areas, represent the international and gender diversity in the science education research community. The volume is organized around six themes: theory and methods of science education research; science learning; culture, gender, and society and science learning; science teaching; curriculum and assessment in science; science teacher education. Each chapter presents an integrative review of the research on the topic it addresses—pulling together the existing research, working to understand the historical trends and patterns in that body of scholarship, describing how the issue is conceptualized within the literature, how methods and theories have shaped the outcomes of the research, and where the strengths, weaknesses, and gaps are in the literature. Providing guidance to science education faculty and graduate students and leading to new insights and directions for future research, the Handbook of Research on Science Education, Volume II is an essential resource for the entire science education community.

Text Analysis for the Social Sciences Carl W. Roberts 2020-07-24 This book provides descriptions and illustrations of cutting-edge text analysis methods for communication and marketing research; cultural, historical-comparative, and event analysis; curriculum evaluation; psychological diagnosis; language development research; and for any research in which statistical inferences are drawn from samples of texts. Although the book is accessible to readers having no experience with content analysis, the text analysis expert will find substantial new material in its pages. In particular, this collection describes developments in semantic and network text analysis methodologies that heretofore have been accessible only among a smattering of methodology journals. The book's international and cross-disciplinary content illustrates the breadth of quantitative text analysis applications. These applications demonstrate the methods' utility for international research, as well as for practitioners from the fields of sociology, political science, journalism/communication, computer science, marketing, education, and English. This is an "ecumenical" collection that contains applications not only of the most recent semantic and network text analysis methods, but also of the more traditional thematic method of text analysis. In fact, it is originally with this volume that these two "relational" approaches to text analysis are defined and contrasted with more traditional "thematic" text analysis methods. The emphasis here is on application. The book's chapters provide guidance regarding the sorts of inferences that each method affords, and up-to-date descriptions of the human and technological resources required to apply the methods. Its purpose is as a resource for making quantitative text analysis methods more accessible to social science researchers.

The Science of Leadership Julian Barling PhD 2014-01-02 In The Science of Leadership, Julian Barling takes an evidenced-based approach, relying primarily on the knowledge generated from research on organizational leadership conducted around the world and personal reflections based on two decades of involvement in leadership research and leadership development with executives. While leadership has been studied within all the major social sciences, Barling mainly focuses on findings from psychological research. The first part of the book explains the nature of organizational leadership, responds to the question of whether leaders "matter," and explains how leadership works. A longstanding issue is whether leadership can be taught. Barling explores the debate over whether leadership is "born or made" as well as the effectiveness of leadership development interventions in organizations. He gives consideration to what can be learned from leadership in other contexts such as sports, the political arena, and schools, and devotes individual chapters to topics that include gender and leadership, destructive leadership, and followership.

Evolutionary Theory in Social Science M. Schmid 2012-12-06 In retrospect the 19th century tmdoubtedly seems to be the century of evolutionism. The 'discovery of time' and therewith the experience of variability was made by many sciences: not only historians worked on the elaboration and interpretation of this discovery, but also physicists, geographers, biologists and economists, demographers, archaeologists, and even philosophers. The successful empirical fotmdation of evolutive processes by Darwin and his disciples suggested Herbert Spencer's vigorously pursued efforts in searching for an extensive' catalogue of prime and deduced evolutionary principles that would allow to integrate the most different disciplines of natural and social sciences as well as the efforts of philosophers of ethics and epistemologists. Soon it became evident, however, that the claim for integration anticipated by far the actual results of these different disciplines. Darwin I s theory suffered from the fact that in the beginning a hereditary factor which could have his theory could not be detected, while the gainings of grotmd supported in the social sciences got lost in consequence of the completely ahistorical or biologicistic speculations of some representatives of the evolutionary research program and common socialdarwinistic misinterpretations.
